Internet speed is one of the biggest considerations when choosing an internet service provider. It determines not only how quickly we can perform tasks online, but how many of those tasks our network can handle at a single time.

Internet speed refers to how much data and information can be transferred over the web on a single connection at any given time.

This is important for colleges because our internet speed determines what types of activities we can do on the internet, as well as how many devices we can connect at once. Understanding how faculty and students use the internet at Higher Education Institution will help we determine which internet speeds we need to get from our provider.

Our college is having two types of internet communications. First is BSNL with 5 Mbps speed which is fulfilling office and administration work. Another BSNL (Optical Fiber) with 100 Mbps for students with LAN facility.
